

**PROTECT TF200®  
& HOW IT WORKS**

Protect TF200 is a high performance breather membrane with high wet strength, water resistance and vapour permeability.

It is used in single skin timber framed panel construction to provide a second line of protection against rainwater penetration during the life of the building and allows water vapour to escape from the structure.

- ★ Used on our range of insulated buildings as the first layer between the framework and exterior cladding
- ★ Perfect if you are looking to insulate your building at a later date
- ★ Recommended if you are looking to add internal electrics
- ★ Resists the passage of water, wind-blown snow and dust into the interior of the buildings
- ★ Good water penetration resistance
- ★ Good tear resistance
