

PROTECT TF200

olympian

GARDEN BUILDINGS

Protect TF200 is a high performance breather membrane with high wet strength, water resistance and vapour permeability.

It is used in timber framed panel construction to provide a second line of protection against rainwater penetration during the life of the building and allows water vapour to escape from the structure.

- Perfect if you are looking to insulate your building at a later date
- Used on our range of insulated buildings as the first layer between the framework and exterior cladding
- Resists the passage of water, wind-blown snow and dust into the interior of the buildings
- Good water penetration resistance
- Good nail tear resistance
- Factory applied, non-reflective embossed and textured surface to minimise surface glare
